

MTBX MANUAL

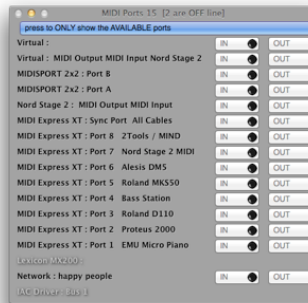

MIDI TEST BoX for OSX v1.00

1 CONTENTS

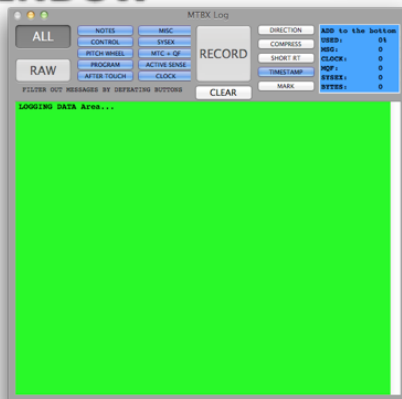

2 METER WINDOW

3 PORTS WINDOW

4 LOG WINDOW

5 LEDS

2 METER WINDOW

your main window for real time information, this window is **NOT** resizable

KEYBOARD:
shows current keys from INPUT and sends to OUTPUTS
[80] NOTE OFF [90] NOTE ON
lowercase note off is a note on message with 00 velocity

CHANNEL SELECTOR:
from keyboard

MESSAGES:
shows last message, of type, is shown in box
[80] NOTE OFF
[90] NOTE ON
[B0] CONTROL CHANGE
[E0] PITCH WHEEL
[C0] PROGRAM CHANGE
[A0] POLY AFTER TOUCH
[D0] CHANNEL AFTER T
[F0] SYSTEM EXCLUSIVE

INPUT: shows any activity detected

CLOCK: [F8]
TEMPO shown in BPM

ACTIVE SENSING:
message seen [FE]

KEYBOARD Range:
more or less octaves
shift octaves up and down

PANIC:
transmits
all notes
OFF on all channels

ECHO: sends Output message to the INPUT MESSAGE system
WHY?: to see what your sending

CLEAR: removes all message information, so you can see any new messages

PING: transmits
TUNE REQUEST [F6] and checks the time taken to get an echo back (PING)
This is a loop back test to find out what latency of the system is, the time displayed is the length to see the returned message, therefore 2 x the expected latency

TIMECODE:
QUARTER FRAME [F1] and MIDI TIMECODE
shows frame rate and any dropouts detected

CHANNEL MESSAGES:
light channel LED
[80] NOTE OFF
[90] NOTE ON
[B0] CONTROL CHANGE
[E0] PITCH WHEEL
[C0] PROGRAM CHANGE
[A0] POLY AFTER TOUCH
[D0] CHANNEL AFTER TOUCH

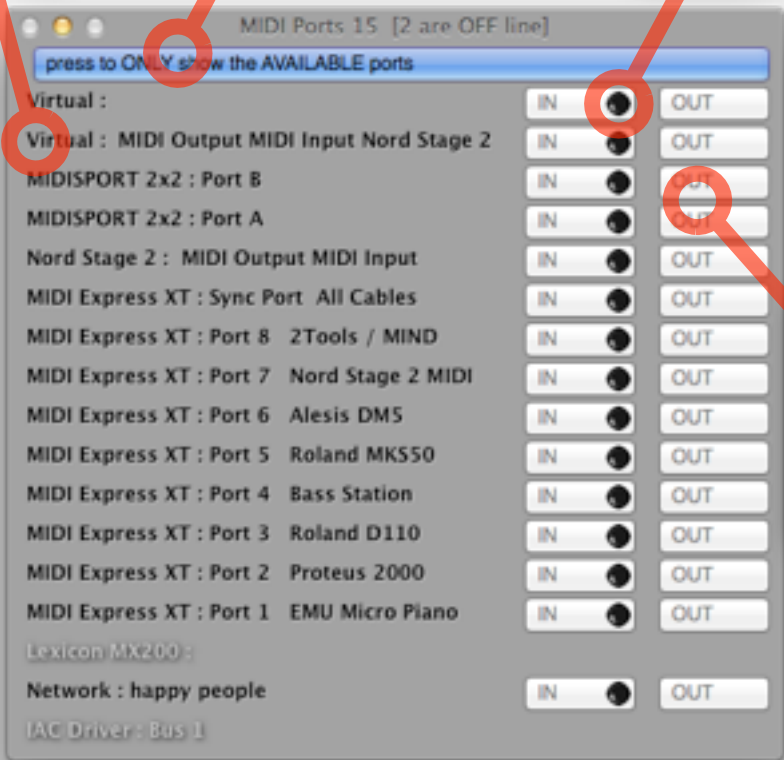

3 PORTS WINDOW

select IN and OUTs connected to, this window is **NOT** resizable

PORT NAME:
This is the automatic name given by the port driver

AVAILABLE PORTS:
enable this to show the OSX history of previously connected devices, that are NOT currently on-line (switched off or not connected). these are greyed out

IN:
only one INPUT at a time (v1.00) can be routed to the meter and log. the LED flashes when inputs are detected

OUT:
any and all OUT can be selected. Any send (from KEYBOARD etc) will go to all selected OUTPUTS in parallel

4 LOG WINDOW

allows for recording of all or any messages in varied ways, window **IS** resizable

ALL FILTERS:
ON or OFF

FILTERS:
lets messages through when enabled (ON)

START / STOP RECORDING
starts and stops the log recording - Doh

STATISTICS:
realtime info of number of message types as they arrive

RAW:
toggles pure HEX data, you need to be a real geek to want this, but I thought it was very sophisticated in 1985

FORMAT DISPLAY:
changes the way the data is shown

MARK:
put a text mark into the log window

TIMESTAMP:
enables a timestamp for each message

MTBX Log

5 LEDS

INPUT

This **LED** lights to show any MIDI message to the METERS from INPUT Ports

OUTPUT

This **LED** lights to show any MIDI message is sent from MTBX to OUTPUT Ports

A-SEN

The **LED** lights when an ACTIVE SENSING (F'E) message is seen. This message has no action, other than to show that the transmitting device is active, common in older MIDI Keyboard and controllers. The DX7 sends this out at quite a high rate !

CLK

The **LED** lights when a TIMING CLOCK (F'8) is detected. This is a single byte message that used to provide a tempo division. They come very quick so the **LED** will stay solid most of the time when they are being sent.

BPM

Calculates the TEMPO of TIMING CLOCKS (F'8). This is displayed in BPM - calculated using an average over time. Based on 24 clocks per crotchet (quarter note). If there is no CLOCK then the last calculated BPM will be continue to be displayed.

NOTE

LED lights when a NOTE ON (90-9F) or NOTE OFF (80-8F) message is present, the latest message is then shown on the corresponding **BLUE** LCD panel. Showing channel, note and velocity information. The appropriate channel **LED** will also light (on the right of the screen).

CCNTR

CONTROL CHANGE messages (B0-BF) light this **LED**, the last control change message is shown in the **BLUE** LCD panel. Shows channel, controller and value. The appropriate channel **LED** will also show.

P-WH

PITCH WHEEL (E0-EF) movements are show **GREEN** here, the latest pitch change is shown in the P-WH **BLUE** LCD panel. Shown as channel and 14 bit signed value. The appropriate channel **LED** will also show.

PRG

PROGRAM CHANGE (C0-CF) values get shown here on the **GREEN** LED, the channel and number is shown on the LCD panel. Channel **LED** flashes.

P-AT

LED lights when a POLYPHONIC AFTER TOUCH (A0-AF) message is found, the last message is then shown in the corresponding **BLUE** LCD panel. Showing channel, note

and after touch value. The appropriate channel **LED** will also light (on the right of the screen).

C-AT

The CHANNEL AFTER TOUCH (D0–DF) message lights this **GREEN** LED and the details are shown on the LCD. Shows channel and after touch value. The channel **LED** also light.

MISC

The LED lights when the STOP (FE), START (FE), CONTINUE (FE), SONG NUMBER (FE) or SONG POSITION (FE) messages are seen. The name of the message is shown in the **BLUE** area. No channel LED lights for these.

SYSEX

The LED lights when a completed SYSTEM EXCLUSIVE (F0) message is found. The message and hexadecimal bytes are shown in the scrollable **BLUE** area. The number of bytes making up the message is shown before the message (that is enclosed in square brackets). No channel LED are associated with SYSEX messages. However further interpretation may produce MIDI TIME CODE messages that are shown in the TIMECODE LCD field.

~~Touching any of the labels to the left of the **LED** clears the **BLUE** LCD area – allowing for a new message to be more easily seen.~~ not available in v1.00

CHANNEL LEDS

Down the right side light when a channel message is seen for that channel:
example:

- NOTE ON Channel 15 = 0x9E, note, velocity
- NOTE OFF Channel 2 = 0x81, note, velocity

The LEDs will flash once for a NOTE ON and again for a NOTE OFF
